

# Gomory - HU trees (from Korte & Vygen Section 8.6)

Definition 8.3: Let  $G=(V,E)$  and  $u:E \rightarrow \mathbb{R}_+$

A tree  $T$  is a **Gomory-HU tree** for  $G$  if

- $V(T) = V(G)$
- $\forall s,t \in V(G): \lambda_G(s,t) = \min \{u(\delta_G(C_e)) \mid e \in E(P_{st})\}$

Here  $P_{st}$  is the unique  $(s,t)$ -path in  $T$  and for all  $e \in E(T)$

$C_e, V-C_e$  are the vertex sets of the 2 connected components of

In  $G$  we denote by  $\delta(C_e)$  the set of edges between  $C_e$  and  $V-C_e$

Goal: prove that every  $(G,u)$  has a Gomory-HU tree

Consequence:  $\forall (G,u) \exists$  list of  $n-1$  cuts such that  $\forall p,q \in V$  one of them cuts is a minimum  $(p,q)$ -cut

Lemma 8.30  $\forall i, j, k \in V(G)$  we have  $\lambda_{ik} \geq \min\{\lambda_{ij}, \lambda_{jk}\}$   
 where  $\lambda_{ij}$  is the maximum number of edge-disjoint  $(i, j)$ -paths in  $G$

proof: Consider a minimum  $(i, k)$ -cut  $(X, \bar{X})$

$$\lambda_{st} = u(\delta(X))$$

if  $j \in X$  then  $\lambda_{jk} \leq \lambda_{ik}$

if  $j \in \bar{X}$  then  $\lambda_{ij} \leq \lambda_{ik}$   $\square$

Main idea:

- Choose arbitrary  $s, t \in V$  and find a min  $(s, t)$ -cut  $(A, B)$  ( $\lambda_{st} = u(\delta(A))$ )
- If  $\max\{|A|, |B|\} \geq 2$  then may assume  $|B| \geq 2$
- Contract  $A$  to a single vertex and denote the resulting graph by  $G/A$
- Choose distinct vertices  $s', t'$  in  $B$
- Find a minimum  $(s', t')$ -cut in  $G/A$
- Continue this process by always choosing new vertices  $s', t'$  that are not separated by any of the cuts we have found so far

at each step, for every previously determined cut  $(A', B')$  we contract one of  $A', B'$  so that  $s', t'$  are in the non-contracted part

The process ends when each pair of vertices  $i, j$  separated by at least one of the previously determined cuts (there is no non-contracted set of size  $\geq 2$ )

We shall prove that the  $n-1$  cuts determined give us a Gomory-Hu tree  $T$

Main observation: The value of a minimum  $(s', t')$ -cut in  $G/A$  is the same as the value of a minimum  $(s', t')$ -cut in  $G$

Lemma 8.32 let  $G=(V, E)$  and  $u: E \rightarrow \mathbb{R}_+$  be given

let  $s, t \in V$  and let  $(A, V-A)$  be a minimum  $(s, t)$ -cut w.r.t  $u$

let  $s', t' \in V-A$  and let  $G', u'$  be obtained by contracting  $A$  in  $G$

Then

$\forall$  minimum  $(s', t')$ -cut  $(K \cup A, V' - K \cup A)$  in  $G'$

we have  $(K \cup A, V - K \cup A)$  is a minimum  $(s', t')$ -cut in  $G$

that is,  $u(\delta(K \cup A)) = u'(\delta(K \cup A))$   $\square$

Proof: it is sufficient to show that there exist a min  $(s', t')$ -cut  $(A', V-A')$  in  $(G, u)$  such that  $A \subseteq A'$  (contracting  $A$  will not affect such a cut)

let  $(C, V-C)$  be an arbitrary minimum  $(s', t')$  cut in  $(G, u)$  s.t  $s', t' \in V-A$   
without loss of generality we have  $s \in C$  so the picture is as in the diagram below

$$\begin{aligned} u(\delta(A)) + u(\delta(C)) &\geq u(\delta(A \cap C)) + u(\delta(A \cup C)) \\ &\geq u(\delta(A)) + u(\delta(A \cup C)) \end{aligned} \quad \left| \begin{array}{l} (A \cap C, V - A \cap C) \\ \text{is an } (s', t')\text{-cut} \\ \text{so } u(\delta(A \cap C)) \geq u(\delta(A)) \end{array} \right.$$

$\Rightarrow u(\delta(C)) \geq u(\delta(A \cup C))$  so  $(A \cup C, V - A \cup C)$  is also a min  $(s', t')$ -cut in  $(G, u) \Rightarrow (C \cup A, V - C \cup A)$  is a min cut in  $(G', u')$   $\square$

# Gomory-Hu algorithm

(1) Initialize  $V(T) = \{V(G)\}$ ,  $E(T) = \emptyset$

Current  $T: \{V(G)\}$

(2) Choose vertex  $X \in V(T)$  such that  $|X| \geq 2$  as a vertex of  $G$ . If no such  $X$  go to (6)

(3) Choose  $s, t \in X$  with  $s \neq t$ :

For each connected component  $C$  of  $T-X$

Contract  $S_C = \bigcup_{Y \in V(C)} Y$  into one vertex  $v_C$  (in  $G$ )

Now the resulting graph  $G'$  has  $V(G') = X \cup \{v_C \mid C \text{ is a component of } T-X\}$

(4) Find a minimum  $(s, t)$ -cut  $(A', B')$  in  $(G', w')$  and set

$$A = \left( \bigcup_{v_C \in A' - X} S_C \right) \cup (A' \cap X), B = \left( \bigcup_{v_C \in B' - X} S_C \right) \cup (B' \cap X)$$

(5) Let  $V(T) = (V(T) - \{X\}) \cup \{A \cap X, B \cap X\}$

•  $\forall e = \{X_i, Y\} \in E(T)$  s.t.  $e$  is incident to  $X$  in  $T$  do:

if  $Y \in A$  then  $e' := \{A \cap X, Y\}$  else  $e' := \{B \cap X, Y\}$

$E(T) := (E(T) - e) \cup e'$  and  $w(e') := w(e)$

•  $E(T) := E(T) \cup \{A \cap X, B \cap X\}$  with  $w(A \cap X, B \cap X) = w(\delta_{G'}(A'))$

• Go to (2)

(6) Replace all  $\{X\} \in V(T)$  by the vertex  $X$

Replace all  $\{X_i, Y\} \in E(T)$  by  $\{X, Y\}$

Return  $T$

# Example of the algorithm

$$T = \bullet \quad \{a, c, d, e, f\} \mid b \quad \min(a, b) \text{-cut cap} = 5$$

↓

$$T = \begin{array}{c} X \\ \text{---} 5 \text{---} V-X \end{array} \quad \begin{array}{c} \text{---} 5 \text{---} \end{array} \quad \begin{array}{c} \text{---} 5 \text{---} \end{array}$$

Choose  $X = \{a, c, d, e, f\}$  and the pair  $(a, c)$

$G' = 6$  so no contraction. Minimum  $(a, c)$  cut has size 5

e.g.  $\{a, b, d\}, \{c, e, f\}$  new  $T = \begin{array}{c} \text{---} 5 \text{---} \end{array} \begin{array}{c} \text{---} 5 \text{---} \end{array} \begin{array}{c} \text{---} 5 \text{---} \end{array}$

Choose  $X = \{a, d\}$  and contract  $\{c, e, f\}$ :

Minimum  $(a, d)$ -cut has size 6  
 $\{a\}, \{b, d, v_{cef}\}$  is min cut

Choose  $X = \{c, e, f\}$  and contract  $\{a, b, d\}$

Contract  $\{a, b, d\}$

$\{e\}, \{c, f, v_{abd}\}$  min  $(c, e)$ -cut  
 new  $T = \begin{array}{c} \text{---} 6 \text{---} \end{array} \begin{array}{c} \text{---} 5 \text{---} \end{array} \begin{array}{c} \text{---} 5 \text{---} \end{array} \begin{array}{c} \text{---} 5 \text{---} \end{array} \begin{array}{c} \text{---} 5 \text{---} \end{array}$

$\{f\}, \{v_{abd}, c, e\}$  min  $(c, f)$ -cut

Final  $T = \begin{array}{c} \text{---} 6 \text{---} \end{array} \begin{array}{c} \text{---} 5 \text{---} \end{array} \begin{array}{c} \text{---} 5 \text{---} \end{array} \begin{array}{c} \text{---} 5 \text{---} \end{array} \begin{array}{c} \text{---} 5 \text{---} \end{array}$

new  $T$

## Correctness of the algorithm:

Lemma 8.33 Each time step (4) ends we have

(a)  $A \cup B = V(G)$  and (b)  $(A, B)$  is a minimum  $(s, t)$ -cut in  $(G, u)$

Proof (a) is clear

(b) clearly holds after the first execution of (4)  $\Rightarrow G^1 = G$

We now show that (b) is preserved in each iteration of (4)

Let  $C_1, C_2, \dots, C_k$  be the connected components of  $T - X$

Consider contracting  $C_1, C_2, \dots, C_k$  one by one:

For  $i = 0, 1, 2, \dots, k$  the  $(G_i, u_i)$  arise from  $(G, u)$  by contracting

each of  $s_{C_1}, s_{C_2}, \dots, s_{C_i}$  to a single vertex  $v_{C_j}$  for  $j \in [i]$

Thus  $(G_k, u_k)$  is  $(G^1, u^1)$  after executing (3) in the algorithm

Claim  $\forall$  minimum  $(s, t)$ -cut  $(A_i, V(G_i) - A_i)$  in  $(G_i, u_i)$ :

$(A_{i-1}, V(G_{i-1}) - A_{i-1})$  is a minimum  $(s, t)$ -cut in  $(G_{i-1}, u_{i-1})$

where  $A_{i-1} = \begin{cases} (A_i - v_{C_i}) \cup s_{C_i} & \text{if } v_{C_i} \in A_i \\ A_i & \text{if } v_{C_i} \notin A_i \end{cases}$

Applying the claim in the order  $k, k-1, \dots, 2, 1$   
proves (b)

proof of the claim:

Let  $(A_i, V(G_i) - A_i)$  be a minimum  $(s, t)$ -cut in  $(G_i, u_i)$

Since we assumed that (b) holds for the previous iterations (induction)

$(S_{C_i}, V(G_i) - S_{C_i})$  is a minimum  $(s_i, t_i)$ -cut for some  $s_i \in S_{C_i}$  and  $t_i \notin S_{C_i}$

We have  $s, t \in V(G_i) - S_{C_i}$  so Lemma 8.32 implies that

$(A_{i-1}, V(G_{i-1}) - A_{i-1})$  is a minimum  $(s, t)$ -cut in  $(G_{i-1}, u_{i-1})$

Here  $(G_{i-1}, u_{i-1})$  plays the role of  $(G, u)$  in Lemma 8.32 and

$s' = s, t' = t$ .

Lemma 8.34 At any time during the execution of the algorithm until (6) is reached the following invariant (D) + (\*) holds:

(D)  $\forall e \in E(T) \quad w(e) = u \left( \bigcap_{Z \in C_e} Z \right)$  where  $\bigcirc_{C_e} \xrightarrow{e} \bigcirc_{V - C_e}$

(\*)  $\forall e = \{p, q\} \in E(T) \quad \exists p \in P, q \in Q$  such that  $\lambda_p q = w(e)$

Proof The invariant trivially holds when the algorithm starts as  $E(T) = \emptyset$

Assume the invariant holds in the first iteration of (2)-(5) and

Consider now a vertex  $X$  of  $T$  chosen in step (2) in the  $i$ 'th iteration

and let  $s, t, A', B', A, B$  be as in steps (3) + (4)

Only edges incident to  $X$  are affected in step (5)

The new edge from  $A \cap X$  to  $B \cap X$  is set correctly as  $s \in A \cap X, t \in B \cap X$

and  $\lambda_{st} = w(e)$ . So look at some edge  $e = \{X, Y\}$  and assume w.l.o.g.

that it became an edge  $A \cap X - Y$  (argument for  $B \cap X - Y$  analogous)

Since (D), (\*) hold for  $e$  before iteration  $i$  we see that (D) still holds for  $e' = (A \cap X, Y)$  as  $w(e') = w(e) = u\left(\delta\left(\bigcup_{z \in C_e} z\right)\right)$

It remains to prove that  $(*)$  holds for  $e'$ :

let  $p \in X, q \in Y$  have  $\lambda p_q = w(c)$  (they exist as  $(*)$  holds after iteration  $c-1$ )

If  $p \in A \cap X$  we are done  $\Rightarrow z \in Y$  and  $e$  moved to  $e'$

$A \cap X$   
|  
 $e'$   
|  
 $Y$

So assume  $p \in B \cap X$ :

If  $\lambda_{sq} = \lambda_{pq}$  we are done a) then we have

$$\lambda_{sq} = \lambda_{pq} = w(e) = w(e') \quad (w(e') \text{ is ext to } w(e) \text{ in step (5)})$$

So we want to prove  $\lambda_{S_T} = \lambda_{P_T}$

Lemma 8.30 given:  $\lambda_{sq} \geq \min \{ \lambda_{st}, \lambda_{tp}, \lambda_{pq} \}$

By lemma 8.23 (b)  $(A, B)$  is a min  $(s, t)$ -cut and

by lemma 8.35 (i)  $\bigcap_{i \in I} (A_i \cap B) = (\bigcap_{i \in I} A_i) \cap B$   
 $s_i \notin A$  so  $\lambda s_i$  does not change when we contract  $B$   
 (by lemma 8.32)

we also have  $t, p \in B$  so  $\lambda_{sq}$  does not change if we add an edge  $t-p$  with  $\infty$  capacity.

This shows that

$$\lambda_{sg} \geq \min \{ \lambda_{st}, \lambda_{pf} \} \quad (\Delta)$$

$\lambda_{se} \geq \lambda_{pq}$  since  $(A, B)$  is also a  $(p, q)$ -cut

$w(e)$  is the capacity of a cut separating  $X$  and  $Y$   
and thus separating  $s$  and  $t$  ( $s \in X, t \in Y$ )

This shows that  $\lambda_{st} \leq w(e) = \lambda_{pq}$

So (A) implies that  $\lambda_{st} = \lambda_{pq}$  proving that (8)  
holds for  $e'$  after iteration  $i$ .  $\square$ .

Theorem 8.35 The algorithm is correct and it  
finds a Gomory-Hu tree in polynomial time

Proof: Clear that the algorithm is polynomial  
(running time bounded by time for  $(n-1)$  max flow calculations)

Let  $T$  be the output of the algorithm. Clearly  $V(T) = V$   
Let  $s, t \in V$  and let  $P_{st}$  be the unique  $(s, t)$ -path in  $T$   
 $\forall e \in E(P_{st})$  let  $C_e, V - C_e$  be the connected components of  $T - e$

Each of  $(C_e, V - C_e)$  is an  $(s, t)$ -cut so we have

$$\lambda_{st} \leq \min \{ u(\delta(C_e)) \mid e \in P_{st} \} \quad (\nabla)$$

On the other hand, applying Lemma 8.30 repeatedly gives

$$\lambda_{st} \geq \min \{ \lambda_{uv} \mid (u, v) \in E(P_{st}) \} \quad (*)$$

Apply Lemma 8.34 to the situation just before step (6) is executed

$$(*) \text{ implies that } \lambda_{st} \geq \min \{ u(\delta(C_e)) \mid e \in P_{st} \}$$

Now (7) implies that  $\lambda_{st} = \min \{ u(\delta(C_e)) \mid e \in P_{st} \} \quad \square$ .
