Introduction to Computer Science
E15 – Study Groups – Week 43

1. Try doing an `sftp` command on a Linux or Mac computer. You can login to an IMADA computer using the command

   `sftp yourlogin@login.imada.sdu.dk`

   using your own login name for `yourlogin`. Before doing this, use the `man` command to find out how to use it. The most relevant commands are `get`, `put`, `cd`, and `quit`. Try copying files back and forth.

2. Try doing an `ssh` command to login (again on a Linux or Mac computer, or try using PuTTY for Windows) to the same machine as with `sftp`. You can check if the file you put there is actually there.

3. Discuss question 28 on page 212 of the textbook.

4. Try creating an HTML page with at least one link. View it using your browser. (Note that in Chrome, for example, in the `File` menu, there is an option `Open File...` option which will allow you to see an HTML file you have created.) What happens when you try changing the `title` in your HTML code? What is the difference between `h1` and `h2`?

5. View some HTML page on the Internet. Look at the page source (HTML code) for the page. This can be generally be done by saving the page you are looking at in your own directory and then looking at it using an editor.

6. Discuss your experiences with the above experiments, and show each other your HTML code.
