## Discrete Optimization

# Part I <br> Lecture 2 <br> Constraint Programming Overview based on Examples 

Marco Chiarandini

Department of Mathematics \& Computer Science
University of Southern Denmark

## Outline

1. An Initial Example
2. Constraint

[^0]

Put a different number in each circle (1 to 8) such that adjacent circles cannot take consecutive numbers

# Constraint Programming An Introduction by example 

Patrick Prosser with the help of Toby Walsh, Chris Beck, Barbara Smith, Peter van Beek, Edward Tsang, ...

## A Puzzle

- Place numbers 1 through 8 on nodes
- Each number appears exactly once
- No connected nodes have consecutive numbers

## You have 8 minutes!

## Heuristic Search

Which nodes are hardest to number?

## Heuristic Search

## Heuristic Search

Which are the least constraining values to use?

## Heuristic Search

Values 1 and 8

## Heuristic Search

## Values 1 and 8

Symmetry means we don't need to consider: 81

## Inference/propagation

We can now eliminate many values for other nodes

## Inference/propagation

## Inference/propagation

## Inference/propagation

## Inference/propagation

By symmetry

## Inference/propagation

## Inference/propagation

## Inference/propagation

## Inference/propagation

By symmetry

## Inference/propagation

## Inference/propagation

Value 2 and 7 are left in just one variable domain each

## Inference/propagation

And propagate ...

## Inference/propagation

And propagate ...

## Inference/propagation

And propagate ...

## Inference/propagation

Guess a value, but be prepared to backtrack ...

## Inference/propagation

Guess a value, but be prepared to backtrack ...

## Inference/propagation

And propagate ...

## Inference/propagation

And propagate ...

## Inference/propagation

Guess another value ...

## Inference/propagation

Guess another value ...

## Inference/propagation

And propagate ...

## Inference/propagation

And propagate ...

## Inference/propagation

One node has only a single value left ...

## Inference/propagation

## Solution

## The Core of Constraint Computation

- Modelling
- Deciding on variables/domains/constraints
- Heuristic Search
- Inference/Propagation
- Symmetry
- Backtracking

## Hardness

- The puzzle is actually a hard problem
- NP-complete

## Constraint programming

- Model problem by specifying constraints on acceptable solutions
- define variables and domains
- post constraints on these variables
- Solve model
- choose algorithm
- incremental assignment / backtracking search
- complete assignments / stochastic search
- design heuristics

## Example CSP

- Variable, $\mathrm{v}_{\mathrm{i}}$ for each node
- Domain of $\{1, \ldots, 8\}$

- Constraints
- All values used
allDifferent $\left(\mathrm{v}_{1} \mathrm{v}_{2} \mathrm{v}_{3} \mathrm{v}_{4} \mathrm{v}_{5} \mathrm{v}_{6} \mathrm{v}_{7} \mathrm{v}_{8}\right)$
- No consecutive numbers for adjoining nodes
$\left|\mathrm{v}_{1}-\mathrm{v}_{2}\right|>1$
$\left|\mathrm{v}_{1}-\mathrm{v}_{3}\right|>1$

## Outline

## 1. An Initial Example

2. Constraint

3. Send More Money<br>Points to Remember<br>Modeling in MILP

## Constraint Programming - in a nutshell

- Declarative description of problems with
- Variables which range over (finite) sets of values
- Constraints over subsets of variables which restrict possible value combinations
- A solution is a value assignment which satisfies all constraints
- Constraint propagation/reasoning
- Removing inconsistent values for variables
- Detect failure if constraint can not be satisfied
- Interaction of constraints via shared variables
- Incomplete
- Search
- User controlled assignment of values to variables
- Each step triggers constraint propagation
- Different domains require/allow different methods

## Constraint Programming

Constraint Programming: an alternative approach to imperative programming and object oriented programming.

- Variables each with a finite set of possible values (domain)
- Constraint on a sequence of variables: a relationship on their domains

Constraint Satisfaction Problem: finite set of constraints

Constraint Programming $=$ model (representation) + propagation (reasoning, inference) + search (reasoning, inference)

## Basic Process

## More Realistic

## Dual Role of Model

- Allows Human to Express Problem
- Close to Problem Domain
- Constraints as Abstractions
- Allows Solver to Execute
- Variables as Communication Mechanism
- Constraints as Algorithms

## Modelling Frameworks

- MiniZinc (NICTA, Australia)
- NumberJack (Insight, Ireland)
- Essence (UK)
- Allow use of multiple back-end solvers
- Compile model into variants for each solver
- A priori solver independent model(CP, MIP, SAT)

## Framework Process

Human

Compile/Reformulate

## Computational Models

Three main Computational Models to solve (combinatorial) constrained optimization problems:

- Mathematical Programming (LP, ILP, QP, SDP, ...)
- Constraint Programming (CSP as a model, SAT as a very special case)
- Local Search (... and Meta-heuristics)
- Others? Dynamic programming, dedicated algorithms, satisfiability modulo theory, answer set programming, etc.

## Modeling

Modeling:

1. identify:

- parameters
- variables
- domains
- constraints
- objective function
that formulate the problem

2. express what in point 1 ) in a way that allows the solution by available software

## Variables

In MILP: real and integer (mostly binary) variables
In CP:

- finite domain integer (including Booleans),
- continuos with interval constraints
- structured domains: finite sets, multisets, graphs, ...

In LS: integer variables

## Constraint Programming vs MILP

- In MILP we formulate problems as a set of linear inequalities
- In CP we describe substructures (so-called global constraints) and combine them with various combinators.
- Substructures capture building blocks often (but not always) comptuationally tractable by special-purpose algorithms
- CP models can:
- be solved by the constraint engine
- be linearized and solved by their MIP solvers;
- be translated in CNF and solved by SAT solvers;
- be handled by local search
- In MILP the solver is often seen as a black-box In CP and LS solvers leave the user the task of programming the search.
- $\mathrm{CP}=$ model + propagation + search constraint propagation by domain filtering $\rightsquigarrow$ inference search $=$ backtracking or branch and bound or local search

## Outline

## 1. An Initial Example

2. Constraint
3. Send More Money

Points to Remember
Modeling in MILP

## Aims

- Example of Finite Domain Constraint Problem
- Models and Programs
- Constraint Propagation and Search
- Some Basic Constraints: linear arithmetic, alldifferent, disequality
- A Built-in search
- Visualizers for variables, constraints and search

## Problem: Send + More $=$ Money

Send + More $=$ Money
You are asked to replace each letter by a different digit so that

|  | $S$ | $E$ | $N$ | $D$ | + |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $M$ | $O$ | $R$ | $E$ | $=$ |
| $M$ | $O$ | $N$ | $E$ | $Y$ |  |

is correct. Because S and M are the leading digits, they cannot be equal to the 0 digit.

## Modelling

1. Parameters
2. Variables (ie, solution representation)
3. Domains (ie, allowed values for the variables)
4. Constraints

Later Objective Function

## Model

- Each character is a variable, which ranges over the values 0 to 9 .
- An alldifferent constraint between all variables, which states that two different variables must have different values. This is a very common constraint, which we will encounter in many other problems later on.
- Two disequality constraints (variable $X$ must be different from value $V$ ) stating that the variables at the beginning of a number can not take the value 0 .
- An arithmetic equality constraint linking all variables with the proper coefficients and stating that the equation must hold.

## Send More Money: CP model

SEND + MORE = MONEY

- $X_{i} \in\{0, \ldots, 9\}$ for all $i \in I=\{S, E, N, D, M, O, R, Y\}$
- Each letter takes a different digit $\rightsquigarrow 1$ inequality constraint

$$
\text { alldifferent }\left(\left[X_{1}, X_{2}, \ldots, X_{8}\right]\right)
$$

(it substitutes 28 inequality constraints: $X_{i} \neq X_{j}, i, j \in I, i \neq j$ )

- $X_{M} \neq 0, X_{S} \neq 0$
- Crypto constraint $\rightsquigarrow 1$ equality constraint:

|  | $10^{3} X_{1}$ $+10^{2} X_{2}$ $+10 X_{3}$ $+X_{4}$ + <br>  $10^{3} X_{5}$ $+10^{2} X_{6}$ $+10 X_{7}$ $+X_{2}$ | $=$ |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $10^{4} X_{5}$ | $+10^{3} X_{6}$ | $+10^{2} X_{3}$ | $+10 X_{2}$ | $+X_{8}$ |  |

- This is one model, not the model of the problem
- Many possible alternatives
- Choice often depends on the constraint system available Constraints available Reasoning attached to constraints
- Not always clear which is the best model

## Send More Money: CP model

```
from gecode import *
s = space()
letters = s.intvars(8,0,9)
S,E,N,D,M,O,R,Y = letters
s.rel(M,IRT_NQ,0)
s.rel(S,IRT_NQ,0)
s.distinct(letters)
C = [1000, 100, 10, 1,
        1000, 100, 10, 1,
        -10000, -1000, -100, -10, -1]
X = [S,E,N,D,
        M,0,R,E,
        M,O,N,E,Y]
s.linear(C,X, IRT_EQ, 0)
s.branch(letters, INT_VAR_SIZE_MIN, INT_VAL_MIN)
for s2 in s.search():
    print(s2.val(letters))
```

## Send More Money: CP model <br> MiniZinc

```
SEND-MORE-MONEY \equiv
    include "alldifferent.mzn";
    var 1..9: S;
    var 0..9: E;
    var 0..9: N;
    var 0..9: D;
    var 1..9: M;
    var 0..9: 0;
    var 0..9: R;
    var 0..9: Y;
    constraint 1000*S + 100*E + 10* N + D
            +1000*M + 100* 0 + 10* R + E
    = 10000 * M + 1000* O + 100 * N + 10 * E + Y;
    constraint alldifferent([S,E,N,D,M,O,R,Y]);
    solve satisfy;
    output [" ",show(S),show(E),show(N),show(D),"\n",
        "+ ",\operatorname{show(M),show(0),\operatorname{show(R),show(E),"\n",}}\mathbf{=}\mathrm{ ,}
        "= ",show(M),show(0),show(N),show(E),show(Y),"\n"];
```

## Program Sendmory

:- module (sendmory).
:- export (sendmory/1).
:- lib(ic).
sendmory(L):-

$$
\begin{aligned}
& L=[S, E, N, D, M, O, R, Y] \\
& L:: 0 . .9,
\end{aligned}
$$

## alldifferent (L),

$$
\begin{aligned}
& S \# \backslash=0, M \# \backslash=0, \\
& 1000 \star S+100 * E+10 * N+D+ \\
& 1000 \star M+100 * O+10 * R+E \#= \\
& 10000 * M+1000 * O+100 * N+10 * E+Y
\end{aligned}
$$

labeling (L) .

## Question

But how did the program come up with this solution?

## Constraint Setup

- Domain Definition
- Alldifferent Constraint
- Disequality Constraints
- Equality Constraint

The following slides are taken from H. Simonis: H. Simonis' demo, slides 33-134 and his tutorial at ACP2016.

## Domain Definition

$$
\begin{aligned}
& L=[S, E, N, D, M, O, R, Y], \\
& L:: 0.9,
\end{aligned}
$$

$$
[S, E, N, D, M, O, R, Y] \in\{0 . .9\}
$$

## Domain Visualization

| $R$ |  |  |  |  |  |  |  |  |  |  |
| Y |  |  |  |  |  |  |  |  |  |  |

## Alldifferent Constraint

alldifferent(L),

- Built-in of ic library
- No initial propagation possible
- Suspends, waits until variables are changed
- When variable is fixed, remove value from domain of other variables
- Forward checking

## Alldifferent Visualization

Uses the same representation as the domain visualizer

|  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| S |  |  |  |  |  |  |  |  |  |  |
| E |  |  |  |  |  |  |  |  |  |  |
| N |  |  |  |  |  |  |  |  |  |  |
| D |  |  |  |  |  |  |  |  |  |  |
| M |  |  |  |  |  |  |  |  |  |  |
| O |  |  |  |  |  |  |  |  |  |  |
| R |  |  |  |  |  |  |  |  |  |  |
| Y |  |  |  |  |  |  |  |  |  |  |

## Disequality Constraints

$$
\mathrm{S} \# \backslash=0, \mathrm{M} \# \backslash=0,
$$

Remove value from domain

$$
S \in\{1 . .9\}, M \in\{1 . .9\}
$$

Constraints solved, can be removed

## Domains after Disequality

|  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| S |  |  |  |  |  |  |  |  |  |  |
| E |  |  |  |  |  |  |  |  |  |  |
| N |  |  |  |  |  |  |  |  |  |  |
| D |  |  |  |  |  |  |  |  |  |  |
| M |  |  |  |  |  |  |  |  |  |  |
| O |  |  |  |  |  |  |  |  |  |  |
| R |  |  |  |  |  |  |  |  |  |  |
| Y |  |  |  |  |  |  |  |  |  |  |

## Equality Constraint

- Normalization of linear terms
- Single occurence of variable
- Positive coefficients
- Propagation

## Normalization

| $1000^{*} S+$ | $100^{*} E+$ | $10^{*} N_{+}$ | $D$ |  |

## Normalization

## Simplified Equation

$1000 * S+91 * E+10 * R+D=9000 * M+900 * O+90 * N+Y$

## Propagation

$1000 * S^{1 . .9}+91 * E^{0 . .9}+10 * R^{0 . .9}+D^{0 . .9}=$ $9000 * M^{1.9}+900 * O^{0 . .9}+90 * N^{0 . .9}+Y^{0 . .9}$

## Propagation

## Propagation

## Propagation

$$
\begin{aligned}
& \underbrace{1000 * S^{1 . .9}+91 * E^{0 . .9}+10 * R^{0 . .9}+D^{0 . .9}}_{9000 . .9918}= \\
& \underbrace{9000 * M^{1 . .9}+900 * O^{0 . .9}+90 * N^{0 . .9}+Y^{0 . .9}}_{9000 . .9918}
\end{aligned}
$$

Deduction:

$$
M=1, S=9, O \in\{0 . .1\}
$$

## Propagation

$$
\begin{aligned}
& \underbrace{1000 * S^{1 . .9}+91 * E^{0 . .9}+10 * R^{0 . .9}+D^{0 . .9}}_{9000 . .9918}= \\
& \underbrace{9000 * M^{1 . .9}+900 * O^{0 . .9}+90 * N^{0 . .9}+Y^{0 . .9}}_{9000 . .9918}
\end{aligned}
$$

Deduction:

$$
M=1, S=9, O \in\{0 . .1\}
$$

Why? Skip

## Consider lower bound for $S$

$$
\underbrace{1000 * S^{1 . .9}+91 * E^{0.9}+10 * R^{0.9}+D^{0.9}}_{9000 . .9918}=\underbrace{9000 * M^{1 . .9}+900 * O^{0.9}+90 * N^{0.9}+Y^{0 . .9}}_{9000.9918}
$$

- Lower bound of equation is 9000
- Rest of ths (left hand side) $\left(91 * E^{0 . .9}+10 * R^{0 . .9}+D^{0.9}\right)$ is atmost 918
- $S$ must be greater or equal to $\frac{9000-918}{1000}=8.082$
- otherwise lower bound of equation not reached by lhs
- $S$ is integer, therefore $S \geq\left\lceil\frac{9000-918}{1000}\right\rceil=9$
- $S$ has upper bound of 9 , so $S=9$

## Consider upper bound of $M$

$$
\underbrace{1000 * S^{1 . .9}+91 * E^{0.9}+10 * R^{0.9}+D^{0.9}}_{9000 . .9918}=\underbrace{9000 * M^{1 . .9}+900 * O^{0.9}+90 * N^{0.9}+Y^{0 . .9}}_{9000.9918}
$$

- Upper bound of equation is 9918
- Rest of rhs (right hand side) $900 * O^{0 . .9}+90 * N^{0.9}+Y^{0 . .9}$ is at least 0
- $M$ must be smaller or equal to $\frac{9918-0}{9000}=1.102$
- $M$ must be integer, therefore $M \leq\left\lfloor\frac{9918-0}{9000}\right\rfloor=1$
- $M$ has lower bound of 1 , so $M=1$

## Consider upper bound of $O$

$$
\underbrace{1000 * S^{1 . .9}+91 * E^{0.9}+10 * R^{0.9}+D^{0.9}}_{9000 . .9918}=\underbrace{9000 * M^{1 . .9}+900 * O^{0.9}+90 * N^{0.9}+Y^{0 . .9}}_{9000.9918}
$$

- Upper bound of equation is 9918
- Rest of rhs (right hand side) $9000 * 1+90 * N^{0 . .9}+Y^{0 . .9}$ is at least 9000
- O must be smaller or equal to $\frac{9918-9000}{900}=1.02$
- O must be integer, therefore $O \leq\left\lfloor\frac{9918-9000}{900}\right\rfloor=1$
- O has lower bound of 0 , so $O \in\{0 . .1\}$

## Propagation of equality: Result

|  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Points to Remember

## labeling built-in

labeling ([S, E, N, D, M, O, R, Y])

- Try variable is order given
- Try values starting from smallest value in domain
- When failing, backtrack to last open choice
- Chronological Backtracking
- Depth First search

## Search Tree Step 1

## S <br> 9 <br> E

Variable $S$ already fixed

## Step 2, Alternative $E=4$

Variable $E \in\{4.7\}$, first value tested is 4
$S$
9
$E$
4

## Assignment $E=4$

|  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $S$ |  |  |  |  |  |  |  |  |  |  |
| $E$ |  |  |  |  | * | - | - | - |  |  |
| N |  |  |  |  |  |  |  |  |  |  |
| $D$ |  |  |  |  |  |  |  |  |  |  |
| $M$ |  |  |  |  |  |  |  |  |  |  |
| $O$ |  |  |  |  |  |  |  |  |  |  |
| $R$ |  |  |  |  |  |  |  |  |  |  |
| $Y$ |  |  |  |  |  |  |  |  |  |  |

## Propagation of $E=4$, equality constraint

$$
91 * 4+10 * R^{2.8}+D^{2.8}=90 * N^{5.8}+Y^{2.8}
$$

## Propagation of $E=4$, equality constraint

$$
\underbrace{91 * 4+10 * R^{2 . .8}+D^{2.8}}_{386 . .452}=\underbrace{90 * N^{5 . .8}+Y^{2 . .8}}_{452 . .728}
$$

## Propagation of $E=4$, equality constraint

$$
\underbrace{91 * 4+10 * R^{2 . .8}+D^{2 . .8}=90 * N^{5 . .8}+Y^{2 . .8}}_{452}
$$

## Propagation of $E=4$, equality constraint

$$
\begin{gathered}
\underbrace{91 * 4+10 * R^{2.8}+D^{2.8}=90 * N^{5.8}+Y^{2.8}}_{452} \\
N=5, Y=2, R=8, D=8
\end{gathered}
$$

## Result of equality propagation

Points to Remember
Modeling in MILP

## Points to Remember

- Constraint models are expressed by: variables + constraints + parameters
- Problems can have many different models, which can behave quite differently. Choosing the best model is an art.
- Constraints can take many different forms.
- Propagation deals with the interaction of variables and constraints: It removes some values that are inconsistent with a constraint from the domain of a variable.
- Constraints only communicate via shared variables.

## Points to Remember

- Propagation is data driven, and can be quite complex even for small examples.
- Propagation usually is not sufficient, search may be required to find a solution.
- The default search uses chronological depth-first backtracking, systematically exploring the complete search space.
- The search choices and propagation are interleaved, after every choice some more propagation may further reduce the problem.

## Applications

- Operation research (optimization problems)
- Graphical interactive systems (to express geometrical correctness)
- Molecular biology (DNA sequencing, 3D models of proteins)
- Finance
- Circuit verification
- Elaboration of natural languages (construction of efficient parsers)
- Scheduling of activities
- Configuration problem in form compilation
- Generation of coerent music programs [Anders and Miranda [2011]].
- Data bases
- http://hsimonis.wordpress.com/

## Applications

Distribution of technology used at Google for optimization applications developed by the operations research team

[Slide presented by Laurent Perron on OR-Tools at CP2013]

## List of Contents

- Modeling with Finite Domain Integer Variables
- Introduction to Gecode
- Overview on global constraints
- Notions of local consistency
- Constraint propagation algorithms
- Filtering algorithms for global constraints
- Search
- Set variables
- Symmetries

## Outline

## 1. An Initial Example

Points to Remember
Modeling in MILP

## Send More Money: ILP model 1

- $x_{i} \in\{0, \ldots, 9\}$ for all $i \in I=\{S, E, N, D, M, O, R, Y\}$
- $\delta_{i j}= \begin{cases}0 & \text { if } x_{i}<x_{j} \\ 1 & \text { if } x_{j}<x_{i}\end{cases}$
- Crypto constraint:

$$
\begin{array}{llllll} 
& 10^{3} x_{1} & +10^{2} x_{2} & +10 x_{3} & +x_{4} & + \\
& 10^{3} x_{5} & +10^{2} x_{6} & +10 x_{7} & +x_{2} & = \\
\hline 10^{4} x_{5} & +10^{3} x_{6} & +10^{2} x_{3} & +10 x_{2} & +x_{8} &
\end{array}
$$

- Each letter takes a different digit:

$$
\begin{array}{ll}
x_{i}-x_{j}-10 \delta_{i j} \leq-1, & \text { for all } i, j, i<j \\
x_{j}-x_{i}+10 \delta_{i j} \leq 9, & \text { for all } i, j, i<j
\end{array}
$$

## Send More Money: ILP model 2

- $x_{i} \in\{0, \ldots, 9\}$ for all $i \in I=\{S, E, N, D, M, O, R, Y\}$
- $y_{i j} \in\{0,1\}$ for all $i \in I, j \in J=\{0, \ldots, 9\}$
- Crypto constraint:

$$
\begin{array}{llllll} 
& 10^{3} x_{1} & +10^{2} x_{2} & +10 x_{3} & +x_{4} & + \\
& 10^{3} x_{5} & +10^{2} x_{6} & +10 x_{7} & +x_{2} & = \\
\hline 10^{4} x_{5} & +10^{3} x_{6} & +10^{2} x_{3} & +10 x_{2} & +x_{8} &
\end{array}
$$

- Each letter takes a different digit:

$$
\begin{array}{ll}
\sum_{j \in J} y_{i j}=1, & \forall i \in I, \\
\sum_{i \in I} y_{i j} \leq 1, & \forall j \in J, \\
x_{i}=\sum_{j \in J} j y_{i j}, & \forall i \in I .
\end{array}
$$

## Send More Money: ILP model

The quality of these formulations depends on both the tightness of the LP relaxations and the number of constraints and variables (compactness)

- Which of the two models is tighter? project out all extra variables in the LP so that the polytope for LP is in the space of the $x$ variables. By linear comb. of constraints:

$$
\begin{array}{cc}
\text { Model } 1 \\
-1 \leq x_{i}-x_{j} \leq 10-1 & \text { Model 2 } \\
\sum_{j \in J} x_{j} \geq \frac{|J|(|J|-1)}{2}, & \forall J \subset I \\
& \sum_{j \in J} x_{j} \leq \frac{|J|(2 k-|J|)+1}{2}, \quad \forall J \subset I
\end{array}
$$

- Can you find the convex hull of this problem? Williams and Yan [2001] prove that model 2 is facet defining

Suppose we want to maximize MONEY, how strong is the upper bound obtained with this formulation? How to obtain a stronger upper bound?

## Send More Money: ILP model (revisited)

- $x_{i} \in\{0, \ldots, 9\}$ for all $i \in I=\{S, E, N, D, M, O, R, Y\}$
- Crypto constraint:

|  | $10^{3} x_{1}$ $+10^{2} x_{2}$ $+10 x_{3}$ $+x_{4}$ + <br>  $10^{3} x_{5}$ $+10^{2} x_{6}$ $+10 x_{7}$ $+x_{2}$ | $=$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $10^{4} x_{5}$ | $+10^{3} x_{6}$ | $+10^{2} x_{3}$ | $+10 x_{2}$ | $+x_{8}$ |  |

- Each letter takes a different digit:

$$
\begin{array}{ll}
\sum_{j \in J} x_{j} \geq \frac{|J|(|J|-1)}{2}, & \forall J \subset I \\
\sum_{j \in J} x_{j} \leq \frac{|J|(2 k-|J|)+1}{2}, & \forall J \subset I
\end{array}
$$

But exponentially many!

## Send More Money: CP model (revisited)

- $X_{i} \in\{0, \ldots, 9\}$ for all $i \in I=\{S, E, N, D, M, O, R, Y\}$
- $\begin{array}{llllll} &$| $10^{3} X_{1}$ | $+10^{2} X_{2}$ | $+10 X_{3}$ | $+X_{4}$ | + |
| :--- | :--- | :--- | :--- | :--- |
| $10^{3} X_{5}$ | $+10^{2} X_{6}$ | $+10 X_{7}$ | $+X_{2}$ | $=$ |
| $10^{4} X_{5}$ | $+10^{3} X_{6}$ | $+10^{2} X_{3}$ | $+10 X_{2}$ | $+X_{8}$ | \& \end{array}

$$
\text { alldifferent }\left(\left[X_{1}, X_{2}, \ldots, X_{8}\right]\right)
$$

- Redundant constraints (5 equality constraints)

$$
\begin{aligned}
X_{4}+X_{2} & =10 r_{1}+X_{8}, \\
X_{3}+X_{7}+r_{1} & =10 r_{2}+X_{2}, \\
X_{2}+X_{6}+r_{2} & =10 r_{3}+X_{3}, \\
X_{1}+X_{5}+r_{3} & =10 r_{4}+X_{6}, \\
+r_{4} & =X_{5} .
\end{aligned}
$$

Can we do better? Can we propagate something?

## Send Most Money: CP model

## Gecode-python

## Optimization version:

$$
\max \sum_{i \in I^{\prime}} C_{i} X_{i}, I^{\prime}=\{M, O, N, E, Y\}
$$

from gecode import *

```
s = space()
letters = s.intvars(8,0,9)
S,E,N,D,M,O,T,Y = letters
s.rel(M,IRT_NQ,0)
s.rel(S,IRT_NQ,0)
s.distinct(letters)
C = [1000, 100, 10, 1,
        1000, 100, 10, 1,
        -10000, -1000, -100, -10, -1]
X = [S,E,N,D,
        M,0,S,T,
        M,0,N,E,Y]
s.linear(C,X,IRT_EQ,0)
money = s.intvar(0,99999)
s.linear([10000,1000,100,10,1],[M,0,N,E,Y], IRT_EQ, money)
s.maximize(money)
s.branch(letters, INT_VAR_SIZE_MIN, INT_VAL_MIN)
for s2 in s.search():
    print(s2.val(money), s2.val(letters))
```

## Strengths

- CP is excellent to explore highly constrained combinatorial spaces quickly
- Math programming is particulary good at deriving lower bounds
- LS is particualry good at derving upper bounds

## Differences

- MILP models
- impose modelling rules: linear inequalities and objectives
- emphasis on tightness and compactness of LP, strength of bounds (remove dominated constraints)
- CP models
- a large variety of algorithms communicating with each other: global constraints
- more expressiveness
- emphasis on exploiting substructres, include redundant constraints

## Resume

- Constraint Satisfaction Problem
- Modelling in CP
- Examples, Send More Money, Sudoku
