Part I
Constraint Propagation Algorithms

Marco Chiarandini

Department of Mathematics & Computer Science
University of Southern Denmark

- ▶ Definitions
(CSP, restrictions, projections, instantiation, local consistency)
- ▶ Tightenings
- ▶ Global consistent (any instantiation local consistent can be extended to a solution) needs exponential time
↪ local consistency defined by condition Φ of the problem
- ▶ Tightenings by constraint propagation: reduction rules + rules iterations
 - ▶ reduction rules $\Leftrightarrow \Phi$ consistency
 - ▶ rules iteration: reach fixed point, that is, closure of all tightenings that are Φ consistent

1. Local Consistency

2. Arc Consistency Algorithms

Node Consistency

We call a CSP **node consistent** if for every variable x every unary constraint on x coincides with the domain of x .

Example

- ▶ $\langle C, x_1 \geq 0, \dots, x_n \geq 0; x_1 \in \mathbb{N}, \dots, x_n \in \mathbb{N} \rangle$
and C does not contain other unary constraints
node consistent
- ▶ $\langle C, x_1 \geq 0, \dots, x_n \geq 0; x_1 \in \mathbb{N}, \dots, x_n \in \mathbb{Z} \rangle$
and C does not contain other unary constraints
not node consistent

A CSP is node consistent iff it is closed under the applications of the **Node Consistency** rule (propagator):

$$\frac{\langle C; x \in D \rangle}{\langle C; x \in C \cap D \rangle}$$

(the rule is parameterised by a variable x and a unary constraint C)

Arc consistency: every value in a domain is consistent with every binary constraint.

- ▶ $C = c(x, y)$ with $\mathcal{D} = \{D(x), D(y)\}$ is **arc consistent** iff
 - ▶ $\forall a \in D(x)$ there exists $b \in D(y)$ such that $(a, b) \in C$
 - ▶ $\forall b \in D(y)$ there exists $a \in D(x)$ such that $(a, b) \in C$
- ▶ \mathcal{P} is arc consistent iff it is AC for all its binary constraints

In general arc consistency does not imply global consistency.
An arc consistent but inconsistent CSP:

A consistent but not arc consistent CSP:

A CSP is arc consistent iff it is closed under the applications of the **Arc Consistency** rules (propagators):

$$\frac{\langle C; x \in D(x), y \in D(y) \rangle}{\langle C; x \in D'(x), y \in D(y) \rangle}$$

where $D'(x) := \{a \in D(x) \mid \exists b \in D(y), (a, b) \in C\}$

$$\frac{\langle C; x \in D(x), y \in D(y) \rangle}{\langle C; x \in D(x), y \in D'(y) \rangle}$$

where $D'(y) := \{b \in D(y) \mid \exists a \in D(x), (a, b) \in C\}$

Theorem

An arbitrary (non-binary) CSP can be polynomially converted into an equivalent binary CSP.

Generalized Arc Consistency (GAC)

Given arbitrary (non-normalized, non-binary) \mathcal{P} , $C \in \mathcal{C}$, $x_i \in X(C)$

(Value) $v \in D(x_i)$ is consistent with C in \mathcal{D} iff \exists a valid tuple τ for C :
 $v_i = \tau[x_i]$. τ is called support for (x_i, v_i)

(Variable) \mathcal{D} is GAC on C for x_i iff all values in $D(x_i)$ are consistent with C in \mathcal{D} (i.e., $D(x_i) \subseteq \pi_{\{x_i\}}(C \cap \pi_{\{X(C)\}}(\mathcal{D}))$)

(Problem) \mathcal{P} is GAC iff \mathcal{D} is GAC for all x in X on all $C \in \mathcal{C}$

\mathcal{P} is arc inconsistent iff the only domain tighter than \mathcal{D} which is GAC for all variables on all constraints is the empty set.

(aka, hyperarc consistency, domain consistency)

Example

 $\langle x = 1, y \in \{0, 1\}, z \in \{0, 1\}; \mathcal{C} = \{x \wedge y = z\} \rangle$

is hyperarc consistent

 $\langle x \in \{0, 1\}, y \in \{0, 1\}, z = 1; \mathcal{C} = \{x \wedge y = z\} \rangle$

is not hyper-arc consistent

Example: arc consistency \neq 2-consistency, AC $<$ 2C on non-normalized binary CSP, and incomparable on arbitrary CSP (later)

A CSP is arc consistent iff it is closed under the applications of the **Arc Consistency** rules (propagators):

$$\langle C; x_1 \in D(x), \dots, x_k \in D(x_k) \rangle$$

$$\langle C; x_1 \in D(x_1), \dots, x_{i-1} \in D(x_{i-1}), x_i \in D'(x_i), x_{i+1} \in D(x_{i+1}), \dots, x_k \in D(x_k) \rangle$$

where $D'(x_i) := \{a \in D(x_i) \mid \exists \tau \in C, a = \tau[x_i]\}$

1. Local Consistency

2. Arc Consistency Algorithms

Arc Consistency

Arc Consistency rule 1 (propagator):

$$\frac{\langle C; x \in D(x), y \in D(y) \rangle}{\langle C; x \in D'(x), y \in D(y) \rangle}$$

where $D'(x) := \{a \in D(x) \mid \exists b \in D(y), (a, b) \in C\}$

This can also be written as (\bowtie represents the join):

$$D(x) \leftarrow D(x) \cap \pi_{\{x\}}(\bowtie(C, D(y)))$$

Arc Consistency rule 2 (propagator):

$$\frac{\langle C; x \in D(x), y \in D(y) \rangle}{\langle C; x \in D(x), y \in D'(y) \rangle}$$

where $D'(y) := \{b \in D(y) \mid \exists a \in D(x), (a, b) \in C\}$

This can also be written as:

$$D(y) \leftarrow D(y) \cap \pi_{\{y\}}(\bowtie(C, D(x)))$$

(Generalized) Arc Consistency rule (propagator):

$$\frac{\langle C; x_1 \in D(x_1), \dots, x_k \in D(x_k) \rangle}{\langle C; x_1 \in D(x_1), \dots, x_{i-1} \in D(x_{i-1}), x_i \in D'(x_i), x_{i+1} \in D(x_{i+1}), \dots, x_k \in D(x_k) \rangle}$$

where $D'(x_i) := \{a \in D(x_i) \mid \exists \tau \in C, a = \tau[x_i]\}$

This can also be written as:

$$D(x_i) \leftarrow D(x_i) \cap \pi_{\{x_i\}}(C \cap \pi_{X(C)}(\mathcal{D}))$$

Revision: making a constraint arc consistent by propagating the domain from a variable to another

Corresponds to:

$$D(x) \leftarrow D(x) \cap \pi_{\{x\}}(\bowtie(C, D(y)))$$

for a given variable x and constraint C

Assume normalized network:

REVISE((x_i, x_j))

input: a subnetwork defined by two variables $X = \{x_i, x_j\}$, a distinguished variable x_i , domains: D_i and D_j , and constraint R_{ij}

output: D_i , such that, x_i arc-consistent relative to x_j

1. **for** each $a_i \in D_i$
2. **if** there is no $a_j \in D_j$ such that $(a_i, a_j) \in R_{ij}$
3. **then** delete a_i from D_i
4. **endif**
5. **endfor**

Complexity: $O(d^2)$ or $O(rd^r)$

d values, r arity

AC1 – Rules Iteration

Binary case

AC-1(\mathcal{R})

input: a network of constraints $\mathcal{R} = (X, D, C)$

output: \mathcal{R}' which is the loosest arc-consistent network equivalent to \mathcal{R}

1. **repeat**
2. **for** every pair $\{x_i, x_j\}$ that participates in a constraint
3. Revise($(x_i), x_j$) (or $D_i \leftarrow D_i \cap \pi_i(R_{ij} \bowtie D_j)$)
4. Revise($(x_j), x_i$) (or $D_j \leftarrow D_j \cap \pi_j(R_{ij} \bowtie D_i)$)
5. **endfor**
6. **until** no domain is changed

- ▶ Complexity (Mackworth and Freuder, 1986): $O(ed^3)$
 e number of arcs, n variables
(ed^2 each loop, a single successful removal causes all loop again $\rightsquigarrow nd$
number of loops)
- ▶ best-case = $O(ed)$
- ▶ Arc-consistency is at least $O(ed^2)$ in the worst case (see later)
- ▶ \rightsquigarrow too many calls to Revise

AC3 (Macworth, 1977)

General case – Arc oriented (coarse-grained)

```
function Revise3(in  $x_i$ : variable;  $c$ : constraint): Boolean ;  
  begin  
    1  CHANGE  $\leftarrow$  false;  
    2  foreach  $v_i \in D(x_i)$  do  
    3    if  $\nexists \tau \in c \cap \pi_{X(c)}(D)$  with  $\tau[x_i] = v_i$  then  
    4      remove  $v_i$  from  $D(x_i)$ ;  
    5      CHANGE  $\leftarrow$  true;  
    6  return CHANGE ;  
  end
```

```
function AC3/GAC3(in  $X$ : set): Boolean ;  
  begin  
    /* initialisation */;  
    7   $Q \leftarrow \{(x_i, c) \mid c \in C, x_i \in X(c)\}$ ;  
    /* propagation */;  
    8  while  $Q \neq \emptyset$  do  
    9    select and remove  $(x_i, c)$  from  $Q$ ;  
    10   if Revise( $x_i, c$ ) then  
    11     if  $D(x_i) = \emptyset$  then return false ;  
    12     else  $Q \leftarrow Q \cup \{(x_j, c') \mid c' \in C \wedge c' \neq c \wedge x_i, x_j \in X(c') \wedge j \neq i\}$ ;  
    13  return true ;  
  end
```

$O(er^3d^{r+1})$ time
 $O(er)$ space

$$\mathcal{P} = \langle X = (x, y, z), \mathcal{D} = \{D(x) = D(y) = \{1, 2, 3, 4\}, D(z) = \{3\}\}, \mathcal{C} = \{C_1 \equiv x \leq y, C_2 \equiv y \neq z\}\rangle$$

Initialisation: Revise (X,c1), (Y,c1), (Y,c2), (Z,c2)

10 + 4 constraint checks

4 + 1 constraint checks

(a)

Propagation: Revise (X,c1)

9 constraint checks

(b)

Binary normalized problems – value oriented (fine grained)

```

function AC4(in X: set): Boolean ;
begin
  /* initialization */;
  1   Q ← ∅; S[xj, vj] = 0, ∀vj ∈ D(xj), ∀xj ∈ X;
  2   foreach xi ∈ X, cij ∈ C, vi ∈ D(xi) do
  3     initialize counter[xi, vi, xj] to |{vj ∈ D(xj) | (vi, vj) ∈ cij}|;
  4     if counter[xi, vi, xj] = 0 then remove vi from D(xi) and add (xi, vi) to
        Q;
  5     add (xi, vi) to each S[xj, vj] s.t. (vi, vj) ∈ cij;

Limitation of Arc Consistency

Example

$$\langle x < y, y < z, z < x; x, y, z \in \{1..100000\} \rangle$$

is inconsistent.

Proof: Apply revise to $(x, x < y)$

$$\langle x < y, y < z, z < x; x \in \{1..99999\}, y, z \in \{1..100000\} \rangle,$$

ecc. we end in a fail.

- ▶ Disadvantage: large number of steps.
Run time depends on the size of the domains!
- ▶ Note: we could prove fail by transitivity of $<$.
↪ Path consistency involves two constraints together
