Discrete Optimization

Lecture 1

# Course Introduction Constraint Programming

Combination

Simplification

Contradiction

Redundancy

# Outline

1. Motivation

2. Course Organization

# You

- ▶ Background
  - study program
  - programming skills
  - other optimization course?
- ▶ Expectations

# Outline

1. Motivation

2. Course Organization

# Main Aim of the Course

To enable the student to solve  
discrete satisfaction and optimization problems  
that arise in practical applications  
by means of constraint programming

# Discrete and Combinatorial Optimization

- ▶ **Discrete optimization** emphasizes the difference to continuous optimization, solutions are described by **integer numbers** or **discrete structures**
- ▶ Combinatorial optimization is a subset of discrete optimization.
- ▶ Combinatorial optimization is the study of the ways **discrete structures** (eg, graphs) can be selected/arranged/combined: Finding an optimal object from a finite set of objects.
- ▶ Discrete/Combinatorial Optimization involves finding a way to efficiently allocate resources in mathematically formulated problems.
- ▶ We will assume **discrete variables with finite domains**.

# Discrete Optimization Problems

## Discrete Optimization problems

They arise in many areas of

Computer Science, Artificial Intelligence, Operations Research...:

- ▶ allocating register memory
- ▶ planning, scheduling, timetabling
- ▶ Internet data packet routing
- ▶ protein structure prediction
- ▶ auction winner determination
- ▶ portfolio selection
- ▶ ...

# Discrete Optimization Problems

Simplified models are often used to formalize real life problems

- ▶ finding models of propositional formulae (SAT)
- ▶ finding variable assignment that satisfy constraints (CSP)
- ▶ partitioning graphs or digraphs
- ▶ partitioning, packing, covering sets
- ▶ finding shortest/cheapest round trips (TSP)
- ▶ coloring graphs (GCP)
- ▶ finding the order of arcs with minimal backward cost
- ▶ ...

## Example Problems

- ▶ They are chosen because conceptually concise, intended to illustrate the development, analysis and presentation of algorithms
- ▶ Although **real-world problems tend to have much more complex formulations**, these problems capture their essence

# Elements of Combinatorial Problems

Combinatorial problems are characterized by an **input**, *i.e.*, a general description of **conditions** (or **constraints**) and **parameters**, and a **question** (or **task**, or **objective**) defining the properties of a **solution**.

They involve finding a **grouping**, **ordering**, or **assignment** of a **discrete**, **finite** set of objects that satisfies given conditions.

**Candidate solutions** are combinations of objects or **solution components** that need not satisfy all given conditions.

**Feasible solutions** are candidate solutions that satisfy all given conditions.

**Optimal Solutions** are feasible solutions that maximize or minimize some criterion or objective function.

**Approximate solutions** are feasible candidate solutions that are not optimal but good in some sense.

# Applied Character

*Optimization problems are very challenging, seldom solvable exactly in polynomial time and no single approach is likely to be effective on all problems.*

*Solving optimization problems remains a very **experimental endeavor**: what will or will not work in practice is hard to predict. [HM]*

Hence the course has applied character:

- ▶ We will learn the theory
- ▶ but also implement some models  $\rightsquigarrow$  programming in MiniZinc
- ▶ and solve them with solvers that implement what we learn in the theory

# Expected prerequisites

Students taking the course are expected to:

- ▶ Be able to use algorithms and data structures
- ▶ Be able to assess the complexity of the algorithms with respect to runtime and space consumption
- ▶ Be able to program

# Outline

1. Motivation

2. Course Organization

# Course Organization

- ▶ Modeling Problems in CP
- ▶ Local Consistency
- ▶ Constraint Propagation
- ▶ Search
- ▶ Symmetry Breaking

# Schedule

- ▶ Class schedule:
  - ▶ See course web page.
  - ▶ [mitsdu.sdu.dk](https://mitsdu.sdu.dk)
  
- ▶ Working load:
  - ▶ Intro phase (Introfase): 28 hours, 14 classes
  - ▶ Skills training phase (Træningsfase): 14 hours, 7 classes
  - ▶ Study phase: (Studiefase) ?? hours

We have 3 classes for 7 weeks scheduled (42 hours).

# COVI19 Situation

Online vs on Campus?

COVID19 is transmitted through aerosols. We have enough evidence.

We need to:

- ▶ Be outdoors
- ▶ Wear fitted, quality masks
- ▶ Improve indoor ventilation

# Assessment

- ▶ Obligatory Assignments:  
Two preparation assignments  
One final
- ▶ Preparation assignments must be passed.
- ▶ Final assignment graded with 7-grade scale + internal censor grade is weighted(?) average of midterm and final assignments.
- ▶ Preparation assignments can be prepared in pairs but individual submission  $\rightsquigarrow$  Feedback
- ▶ Final assignments is individual and only limited communication is allowed.

# Learning Objectives

For a top performance the student must demonstrate ability to:

- ▶ **model** a problem similar in nature to the ones seen in the course within the framework of constraint programming
- ▶ **argue** about the different modeling choices arising from the theory behind the components of constraint programming, including global constraints, propagators, search and branching schemes.
- ▶ **develop** a solution prototype in a constraint programming system
- ▶ **undertake an experimental analysis**, report the results and draw sound conclusions based on them
- ▶ **describe** the work done in an appropriate language including mathematical formalism

# Content of the Graded Assignments

- ▶ Modeling
- ▶ Implementation (deliverable and checkable source code)
- ▶ Written description
- ▶ (Analytical) and experimental analysis
- ▶ Performance counts!

# Competences wrt Degree

- ▶ plan and carry out **scientific projects** at the high professional level including managing work and development situations that are complex, unpredictable and require new solutions
- ▶ describe, analyze and solve **advanced computational problems** using the learned models
- ▶ analyze the **advantages and disadvantages** of various algorithms, especially in terms of resource consumptions
- ▶ elucidate the hypotheses of qualified theoretical background and **critically evaluate** own and others' research and scientific models
- ▶ develop **new variants** of the methods learned where the specific problem requires
- ▶ communicate through a **written report** research based knowledge and discuss professional and scientific problems with peers
- ▶ give expertise in discrete optimization and solution methods from the international research front

# Communication media

- ▶ Public Web Page [WWW] ⇔ BlackBoard [e-learn.sdu.dk](http://e-learn.sdu.dk) [BB]  
(link from <http://www.imada.sdu.dk/~marco/DM877/>)
- ▶ [Announcements](#) in BlackBoard
- ▶ [Course Documents](#) in [BB] (unless linked from [WWW])
- ▶ [Discussion Board](#) (anonymous) in [BB]
- ▶ Personal email [marco@imada.sdu.dk](mailto:marco@imada.sdu.dk)
- ▶ Office visits
- ▶ [\(A-bit-earlier-than\) Mid term evaluation](#) in class

# Literature

**RBW** F. Rossi, P. van Beek and T. Walsh (ed.), [Handbook of Constraint Programming](#), Elsevier, 2006

**SMT** Peter J. Stuckey, Kim Marriott, Guido Tack. MiniZinc Handbook. 2020

- ▶ Coursera's "Basic Modeling for Discrete Optimization"
- ▶ Coursera's "Advanced Modeling for Discrete Optimization"
  
- ▶ Other sources: articles, slides, lecture notes

# Agreement for the Exercise Sessions

- ▶ Read the text before meeting at the class
- ▶ If you encounter difficulties then take note of the question and bring it in the class; it may be useful also for others
- ▶ The meaning with the exercise classes is for you to get feedback, not to deliver new material
- ▶ All questions and comments are welcome
- ▶ There is not stupid/wrong question and by the way we all learn from mistakes.
- ▶ I can ask questions to everybody and it is not to punish someone. You can well say pass.

# Class format

Be prepared for:

- ▶ Flipped classes: learn content at home, engage with material in class
- ▶ Problem solving in class
- ▶ Hands on experience with modeling and programming
- ▶ Experimental analysis of performance
- ▶ Discussion on exercises for home

These activities will be announced

They require study phase (= work outside the classes)
